

POSTS INVEST IN LOCKERS FOR EASY DELIVERY

Logibag, the French manufacturing subsidiary of ByBox, launched its new range of central consoles to control its modular, networked locker columns with large colour touch-screen, signature capture and chip-and-PIN functionality. The first units have already been delivered to La Poste for installation across France.

La Poste utilises the lockers to redirect parcel deliveries to secure, electronic locker locations as requested by customers. Full notification services are provided via email and text message. Failed deliveries are also better managed, with the customer being required to scan a barcode and 'sign' on screen to confirm receipt.

La Poste makes use of a fully-customised web services interface where all customer data is hosted by La Poste and only customer-anonymous data is exchanged between the lockers and information

systems. For other customers, such as Jersey Post, ByBox operates the customer database and provides a full suite of operational and data management screens that integrate seamlessly into the Jersey Post website.

ByBox is one of the few companies able to offer pan-European service coverage via its existing network of agents who already manage and maintain Logibag electronic left luggage locker installations at airport and railway locations across Europe.

Sale, rental and lease-finance options are available and when combined with ease of IT integration and market-leading products, it is time to control deliveries with ByBox.
